METHOD FOR KEYSTROKE DELIVERY TO DESCENDANTS OF INACTIVE WINDOWS

Abstract

A method for delivering keystrokes to descendants of an inactive window includes remembering a descendant of the inactive window as the next focus owner when the descendant receives a focus-in event, creating a focus proxy for the inactive window and issuing a request to set focus to the focus proxy, marking the next focus owner as the true focus owner when the focus proxy receives a focus-in event, and directing the focus-in event received by the focus proxy to the true focus owner.
